this book can form the basis of a second course in algebraic geometry as motivation it takes concrete questions from enumerative geometry and intersection theory and provides intuition and technique so that the student develops the ability to solve geometric problems the authors explain key ideas including rational equivalence chow rings schubert calculus and chern classes and readers will appreciate the abundant examples many provided as exercises with solutions available online intersection is concerned with the enumeration of solutions of systems of polynomial equations in several variables it has been an active area of mathematics since the work of leibniz chasles nineteenth century calculation that there are 3264 smooth conic plane curves tangent to five given general conics was an important landmark and was the inspiration behind the title of this book such computations were motivation for poincaré s development of topology and for many subsequent theories so that intersection theory is now a central topic of modern mathematics

the 1980 maratea nato advanced study institute asi followed the lines of the 1976 liege nato asi indeed the interest of boundary problems for linear evolution partial differential equations and systems is more and more acute because of the outstanding position of those problems in the mathematical description of the physical world namely through sciences such as fluid dynamics elastodynamics electro dynamics electromagnetism plasma physics and so on in those problems the question of the propagation of singularities of the solution has boomed these last years placed in its definitive mathematical frame in 1970 by l hormander this branch of the theory recorded a tremendous impetus in the last decade and is now eagerly studied by the

most prominent research workers in the field of partial differential equations it describes the wave phenomena connected with the solution of boundary problems with very general boundaries by replacing the generailly impossible computation of a precise solution by a convenient asymptotic approximation for instance it allows the description of progressive waves in a medium with obstacles of various shapes meeting classical phenomena as reflexion refraction transmission and even more complicated ones called supersonic waves head waves creeping waves the tudy of singularities uses involved new mathematical concepts such as distributions wave front sets asymptotic developments pseudo differential operators fourier integral operators microfunctions but emerges as the most sensible application to physical problems a complete exposition of the present state of this theory seemed to be still lacking

a significant part of the 2004 summer research conference on algebraic geometry snowbird ut was devoted to lectures introducing the participants in particular graduate students and recent ph d s to a wide swathe of algebraic geometry and giving them a working familiarity with exciting rapidly developing parts of the field one of the main goals of the organizers was to allow the participants to broaden their horizons beyond the narrow area in which they are working a fine selection of topics and a noteworthy list of contributors made the resulting collection of articles a useful resource for everyone interested in getting acquainted with the modern topic of algebraic geometry the book consists of ten articles covering among others the following topics the minimal model program derived categories of sheaves on algebraic varieties kobayashi hyperbolicity groupoids and quotients in algebraic geometry rigid analytic varieties and equivariant cohomology suitable for independent study this unique volume is intended for graduate students and researchers interested in algebraic geometry

this volume is based on lectures given at the workshop on pseudo differential operators held at the fields institute from december 11 2006 to december 15 2006 the two main themes of the workshop and hence this volume are partial differential equations and time frequency analysis the contents of this volume consist of five mini

courses for graduate students and post docs and fifteen papers on related topics of particular interest in this volume are the mathematical underpinnings applications and ramifications of the relatively new stockwell transform which is a hybrid of the gabor transform and the wavelet transform the twenty papers in this volume reflect modern trends in the development of pseudo differential operators
